HOW RACKEYE WORKS

The RackEye solution combines rack-mounted sensor units, intelligent cloud-based analytics and an intuitive app-based user interface to deliver unrivalled rack health data to your smartphone, tablet or PC.

1. Sensors on the warehouse racking instantly detect when an impact occurs, sending a signal to the Conek Gateway.
2. The Conek Gateway notifies the Conek Cloud via Ultra Low Energy (ULE) wireless communications system that works entirely independently from your IT network infrastructure.
3. The incident is logged on the conex cloud, which immediately sends a notification to the Rackeye system user as an alert via the app, dashboard or SMS notification to the warehouse management team.
4. Depending on the severity of the impact, an immediate rack inspection maybe required. The RackEye smartphone app will guide the process in accordance with EN15635:2008.
5. The RackEye Dashboard provides unparalleled insight into impact trends within your warehouse facilities, allowing an array of KPI reporting, including heatmaps of warehouse locations, incidents by rack-leg, aisle, shift, or date to identify hotspots and opportunities for improvement.

CHANGE THE WAY YOU SEE YOUR FACILITIES

Game change how you view the health and condition of racking. The real-time map shows the layout and live state of each individual RackEye sensor, with severity indicators to help you prioritise actions, as well as displaying historic data to make it easier to find problem hotspots and make changes to improve operations.

The live overviews can cover multiple sites across your business from a single dashboard, and also act as a visual aid to engage drivers and warehouse staff in improving efficiency.

MAKE A POSITIVE IMPACT ON YOUR BUSINESS

Book your demo now and advance the operations of your facilities in just one day.
